NOVELTIES AND SPECIALTIES IN FLOWER SEEDS

Eschscholtzia—“Dainty Queen”

while also useful for pot culture, and, considering the long time the flowers last when cut, we may safely predict for this novelty an unusually successful career. Pkt. 25c.

PETUNIA

King Alphonso (Benary). This fine new

Petunia of the Grandiflora superbissima class bears very large dark crimson flowers like those of the variety Prince of Württemberg, but the petals of this novelty are boldly waved and frilled to such an extent that the widely opened brilliant black throat of the flower is often almost entirely concealed. Pkt. 25c.

WALL FLOWER

Annual Blood-Red. This is a much im-

proved and selected stock of the annual Wallflower, brought out some years since, which although so wonderfully early, was a very poor yellow. We have ever since been carefully selecting this, and each year getting nearer to a good blood red, and at last we have succeeded. It is also a larger flower than the old variety and a good blood-red color, and if sown in March can be had in bloom in following July. Pkt. 10c.

CALLIOPSIS

Tom Thumb “Beauty.” This elegant dwarf

and compact growing annual forms a very good comparison to our already popular variety “Tom Thumb Crimson King.” The plants grow about 8 inches high and are literally covered with bloom, the color of which is very showy, being a golden yellow with crimson center. A gem either for pots or borders. Pkt. 25c.

ESCHSCHOLTZIA

Erecta Compacta, “Dainty Queen.”

The color is a tender blush or pale coral pink, slightly deeper toward the edges, with a ground-work of delicate cream, and, like “Intus Rosea,” is quite the same shade inside the flower as outside, so that the effect in color is the same when the flower is open as when closed, which is quite unusual in all other Eschscholtzias. Pkt. 25c.

ALYSSUM

Compactum, Little Dorrit. A grand im-

provement on the already much grown variety Little Gem, being much more compact. This new variety forms a perfect little bush with miniature white rocket flowers. A perfect gem for borders or beds. Pkt. 25c.

CHRYSANTHEMUM

Inodorum, Bridal Robe (Benary).

Of very compact and upright habit, and not exceeding 10 inches in height, the sturdy plants throw out their finely feathered foliage from the base and deck themselves with a mantle of extra-double, pure white flowers. This Chrysanthemum, coming almost true from seed, will certainly prove a bedding-plant of the very first rank,

the long time the flowers last when cut, we may

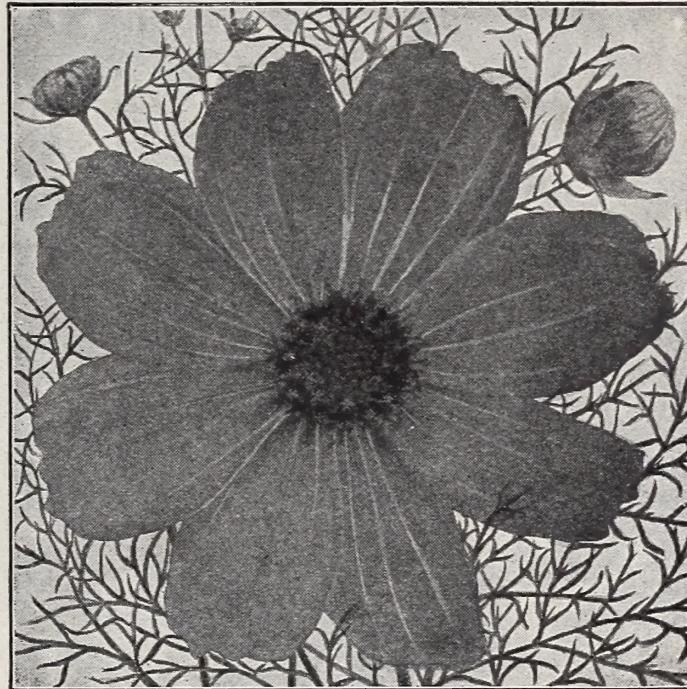

Godetia—“Crimson Glow”

NOVELTIES AND SPECIALTIES IN FLOWER SEEDS

COSMOS

Lady Lenox. (The new gigantic orchid flowering Cosmos.) This gigantic Cosmos is the forerunner of an entirely new race of Cosmos. It is of extraordinary size and beauty. Visitors to the floral exhibitions last Autumn were enraptured with its size and magnificent color.

Size of flower—Six to seven inches in diameter; color—a delightful shell-pink, lighting up beautifully at night. Form of flower—oval petals of splendid substance, forming a perfectly circular flower which, when cut, lasts an unusual length of time in water. Habit of plant—strong and vigorous, growing 6 to 7 feet high. Flowers may be cut with any length of stem up to 5 feet. Pkt. 25c., 5 pkts. \$1.00.

Cosmos—Lady Lenox

GODETIA

Dwarf Compact "Crimson Glow."

This splendid new Godetia forms a compact little bush about 9 inches in height, completely smothered with flowers of the most dazzling intense crimson. Pkt. 25c.

ASTER

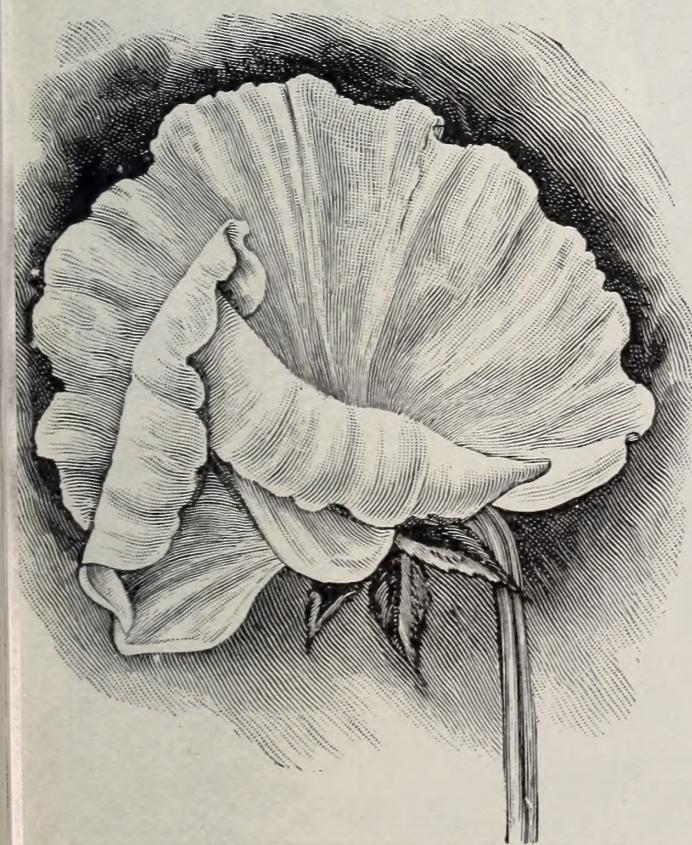

Giant Comet Triumph of Paris. "Of pyramidal habit, this new Aster grows 2 to 2 1/2 feet high and produces large flowers, 4 1/2 to 6 in. across, with long pure white outer petals, in the center of which the quilled disk florets form a bright golden yellow wreath. Pkt. 25c.

SUNFLOWER

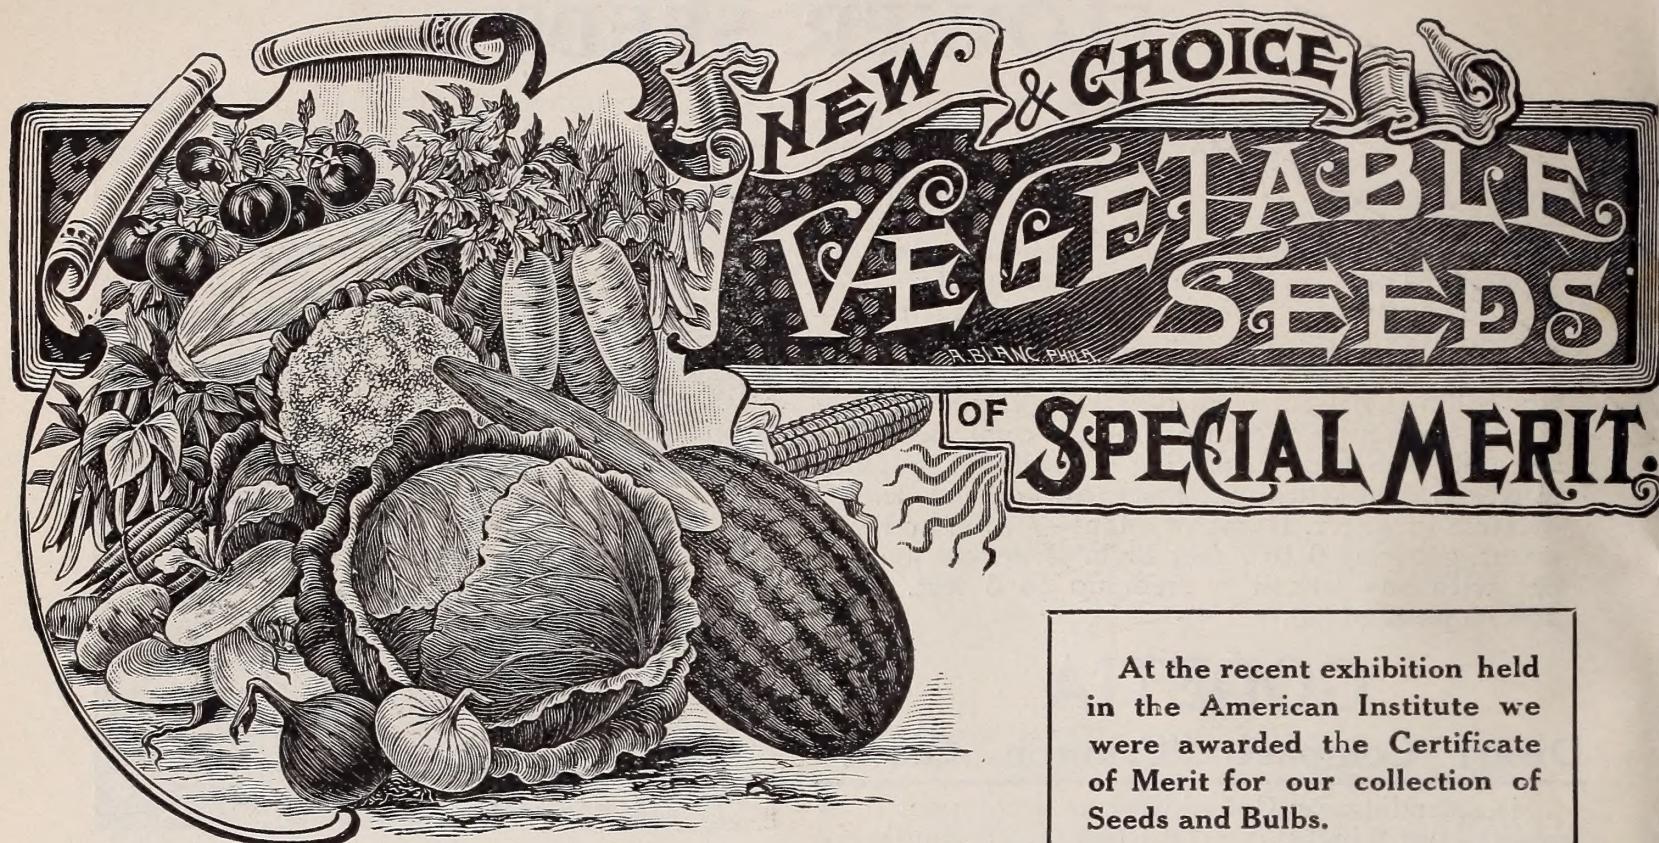

"Starlight." In this new variety of annual single Sunflower we have a fine advance. The flowers are large, of very graceful appearance, and with petals beautifully twisted like a fine form of single Cactus Dahlia. The color of the flowers is a beautiful canary yellow, and borne on long stems; cannot be excelled for cutting purposes. The form of the flowers is most graceful, and lends itself admirably to decorative work and they also have the great merit of lasting a long time in water. Pkt. 25c.

SWEET PEAS

Burpee's White Spencer. Produces in the greatest profusion flowers of enormous size that are absolutely pure white. It is white seeded and comes true to the Countess Spencer type. The standard is decidedly waved, crinkled and fluted; the wavy wings are so folded that the keel is almost hidden. The standard measures from one and three-quarters to two inches across by one and three-eighths to one and five-eighths inches in depth. The wings are fully an inch wide and nearly as deep as the standard. The flowers are borne three and four to the stem and are uniformly well placed. The stems are extra strong and measure from twelve to fifteen inches in length. The vines are most vigorous in growth, with heavy foliage, and attain a height of from ten to twelve feet. They are nearly covered with bloom, while the flowers retain their enormous size throughout the season. Of fine substance, the magnificent flowers are unsurpassed for cutting and for keeping after being cut. Pkt. 25c.

MUSHROOM SPAWN

Culture.—Mushrooms may be grown in cellars, under benches of greenhouses, or in sheds, wherever the temperature of 50 degrees can be kept up through the Winter. The beds should be made from November to February, according to the time the Mushrooms are wanted, and it requires about two months for them to begin bearing. Secure fresh horse-dung, free from straw and litter, and mix an equal bulk of loam from an old pasture with it. Keep this under cover, taking care to turn it every day to prevent heating, until the pile is large enough to make a bed of the required size. Three or four feet wide, 8 inches deep and any length desired, are the proper proportions for a bed; but these may be varied. Prepare the mixture of loam and manure, making the bed in layers, and pounding down each with the back of the spade. Leave this to heat through for a few days, and as soon as the heat subsides to 90 degrees, make holes in the bed about a foot apart each way, into which put pieces of the spawn 2 or 3 inches in diameter; fill up the holes with the compost, and at the expiration of a week or 10 days the spawn will have thoroughly diffused itself through the bed. Spread a layer of fresh soil over the heap to the depth of 2 inches, and cover with 3 or 4 inches of hay, straw or litter. Examine the bed often to see that it does not get dry. Take special care, however, when water is given, that it be at a temperature of about 100 degrees.

From our experience with English, French, and American Spawn we find there is an important difference between them. If the manure in the bed is in proper condition, the French Spawn will take hold and grow fully as well as the other two; but if the bed is not in the right state, it will often rot. The American and English Spawn, on the contrary, after starting a little, will remain in a comparatively dormant state for a long time without losing its vitality. It is well to keep these points in mind in ordering spawn. The French spawn should be slightly moistened by sprinkling with water for two or three days before planting.

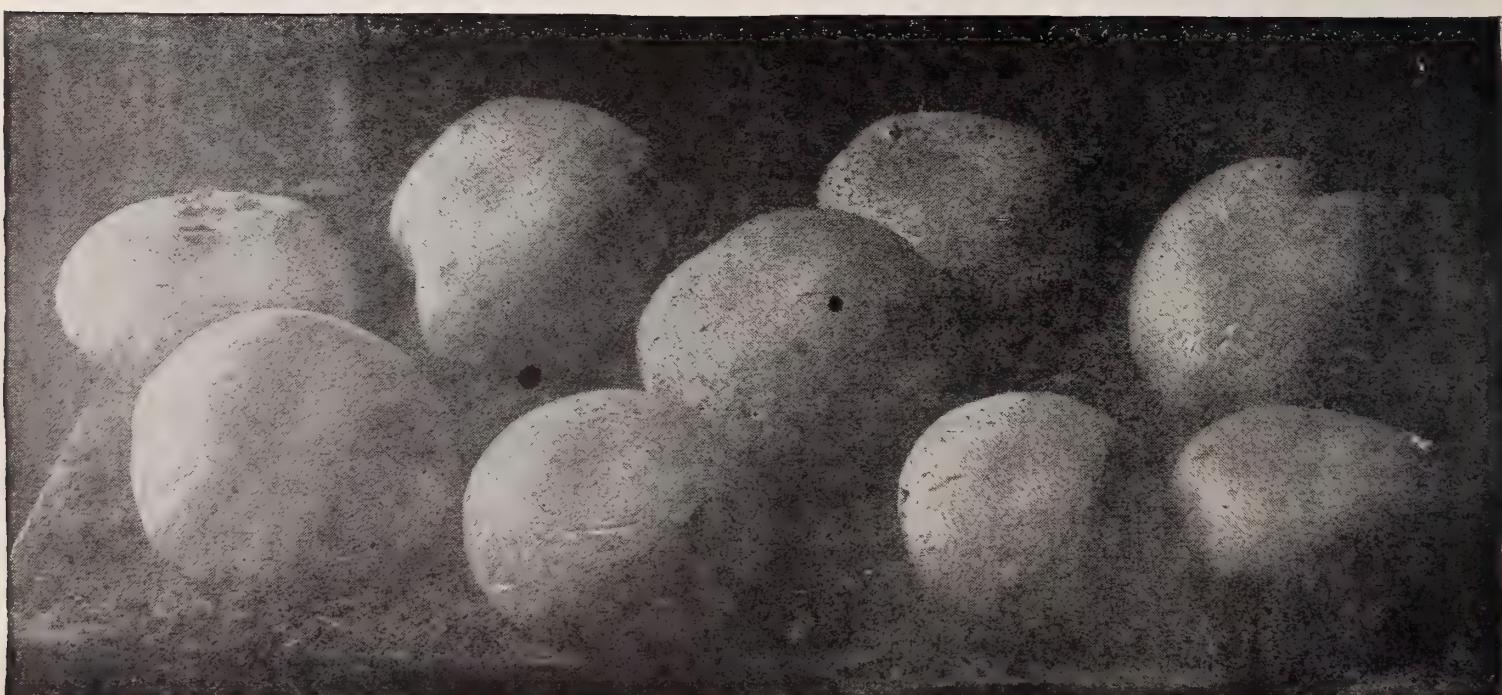

American Pure Culture Spawn. In bricks. **French Spawn.** In bulk. Lb. 30c., 10 lbs. \$2.50.

Muskmelons—Emerald Gem

MUSKMELON

One ounce will plant about 75 hills.

CULTURE.—Select a light, sandy, rich soil, and after all danger of frosts is over, and the ground has become warm and dry, plant in hills 4 to 6 feet apart each way, 6 to 12 seeds to a hill. When up, and all danger of insects has passed, pull out all but 3 plants. Cultivate until the vines cover the ground, and pinch the ends of the growing shoots to induce early fruiting. Ashes, lime, or even dry road dust, is excellent to sift over young plants when the dew is on, to prevent the attacks of insects. A few hills for early use may be had by sowing in hotbeds, on pieces of sod or in pots. The seed may also be started out-of-doors under hand frames or glasses. It is quite important that proper soil be selected for growing Muskmelons.

FLOWER SEED DEPARTMENT

GENERAL DIRECTIONS FOR THE CULTIVATION OF ANNUAL, BIENNIAL AND PERENNIAL FLOWERS

Plants are known and described generally as Annuals, Biennials and Perennials.

Annuals are those plants that flower and mature their seeds within a year after they are sown, and then perish. This definition is in no way changed by the fact that many annuals may be managed as biennials, or, in other words, be sown in Autumn for flowering early the following season.

Tender Annuals are those that require heat, and will not germinate in the open ground until settled warm weather.

Half-Hardy Annuals are those which will bear a slight frost, and may be sown in the open ground a little earlier than tender annuals.

Hardy Annuals are usually those which require no artificial heat during any period of their growth. Every stage of their existence, from the time of sowing the seed to maturity, is passed in the open ground.

Biennials are those plants that flower the second and sometimes the third year after the seed is sown, and then perish.

Perennials are those plants which live and perpetuate their species throughout many years successively.

The last two classes are again divided in respect to their endurance of low temperature, as *Tender*, *Half-Hardy* and *Hardy*.

Tender Biennials and *Perennials* are greenhouse or dwelling-house plants, requiring artificial heat to protect them from frost.

Half-Hardy Biennials and *Perennials* are those that require a slight covering of straw or litter during cold weather.

Hardy Biennials and *Perennials* are those that will stand the coldest Winter weather without protection.

Soils Most Suitable.—The soil best adapted to a majority of plants is a light, friable loam, containing a moderate quantity of vegetable matter, and enough sand to render it porous; but as it seldom happens that the amateur has a choice of soil, it is fortunate that most of them will succeed in any but such as is of an extremely dry or gravelly nature, or of a stiff, heavy, retentive quality.

Manures.—The use of strong, crude manures should be carefully avoided. In ordinarily good soil, an annual dressing of decomposed stable manure, dug in to the depth of about 10 inches, and thoroughly incorporated with the soil, will be all that is needed.

Time of Sowing.—With regard to the proper time of sowing flower seeds, much necessarily depends on the character of the season. As a general rule (near New York city) *hardy* kinds may be sown in the open ground about the middle of April, *half-hardy* kinds during the first week of May, and *tender* kinds after the middle of May.

The best method to obtain early flowers is to sow seeds of the most desirable tender and half-hardy species in pots early in March. If kept in a warm greenhouse or window, or plunged into a moderate hotbed, they will be ready to transplant to the open ground early in May. The season of blooming will be made full three weeks earlier thereby.

Method of Sowing.—Seeds may be sown in patches among the border plants in rows or groups where they are to remain, or in a nursery bed, and afterward transplanted. As a general rule, the surface soil should be rather dry than otherwise at the time of sowing; the operation must not be undertaken when the ground is very wet, especially at an early period of Spring.

The depth at which seeds should be sown will vary with their size. Large seeds, such as Lupins, Marvel of Peru, or Sweet Peas, should be sown about half an inch deep; medium size seeds, such as Balsams, Convolvulus or Thunbergia, about a quarter of an inch deep; while such as are very small require to be sown on the actual surface, a slight pressure being then sufficient to imbed them to a proper depth. If sown too deep, they are longer in germinating, and the smaller ones are liable to decay through want of strength to open the pores of the earth. In the absence of rain, water the seeds occasionally from a watering-pot with a very fine rose.

Transplanting.—As soon as the seedlings are an inch high, they may be transplanted to different parts of the garden. Remove the plants carefully with a small garden trowel, retaining as much of the soil to the roots as possible. Place the large-growing kinds in the rear, and the small in front; above all things, avoid crowding them. Transplanting should, if possible, be performed in cloudy weather, or toward evening; and, unless the soil is wet, the seedlings should be slightly watered, to settle the soil about the roots, shading them for a day or two afterward, if necessary.

The risk and trouble of transplanting may be avoided by adopting the following method of sowing the seeds: Take a package of, say, twenty varieties, and number the bags from 1 to 20; then sow a small circle from each bag in the order in which they are numbered, and insert a short stick in the center of each circle as a mark. By this method the twenty varieties are distributed along the border in succession; and as each bag will be sufficient for about three circles or three assortments of twenty varieties each, they may be sown in three different aspects of the garden, which will not only give the various flowers the best possible chance with regard to exposure, but show the varieties to the best possible advantage. By preserving the bags, the mere novice, by referring to the name and number on each, will become acquainted with the different varieties from the order in which they stand in the garden. This system may be practiced to advantage either on a large or small scale.

Neatness is indispensable in a flower garden, and neither the variety nor beauty of the plants will compensate for its absence. As the plants advance in growth, frequent weeding and hoeing will be necessary, as well for the sake of neatness as to stimulate their growth. Tie the tall-growing kinds to neat rods or sticks, and train the vines or climbers on trellises, strings or poles.

FLOWER SEEDS

The great interest manifested in the cultivation of flowers, and the increasing demand for new varieties, have induced us to give particular attention to this department. In addition to the many kinds grown here, we import annually from England, France and Germany all the standard kinds and novelties as they appear there; and no expense is spared to make the collection as select and varied as any to be found in this country.

For early flowers, sow under glass in February or March and transplant into beds of warm, dry soil moderately enriched. The Snapdragon, like most perennials and biennials which bloom the first year, is treated as an annual and sown every year. Average height, 1½ feet.

Sow seed of biennials outdoors early in July and thin or transplant to temporary quarters until October. Transplant, then, 6 or 8 inches apart, in a cold-frame, where they will make large plants by Spring and are as easily cared for as pansies. Transplant in Spring, 18 to 20 inches apart, in beds where they are to bloom. In June and July they flower most profusely, and are in fine form a long time.

CARNATION

(*Dianthus Caryophyllus*)

Sown under glass in early Spring or later in the open ground, the plants will flower finely the second Summer. For largest, richest flowers we recommend their culture in pots of rich soil, but with many they are also garden favorites, and grown in this way flowers of good quality may be enjoyed all Summer. Young plants are perfectly hardy outdoors, but when two or three years old they are injured by Winter cold, so that sowings should be made every year.

MARGUERITE CARNATIONS are an extra vigorous race especially adapted for outdoor culture. They are very neat in habit, and remarkable for their rich profusion of flowers, produced in five months from sowing. For masses of bloom few plants are finer; and for pots also, their neat habit makes them very suitable. Grown as annuals, from seed sown every Spring, they are most satisfactory. Pkt. 10c., oz. \$2.00.

CHRYSANTHEMUMS

Do not confound these annuals with the Winter-flowering sorts of the florists. They bloom profusely from early Summer until frost, and when grown in large beds or masses their bright colors make a splendid show. The plants can be brought into bloom early by sowing the seed in frames or window boxes, and afterward transplanting to the garden; or seed may be sown where the plants are to flower, if the seedlings are thinned to 8 or 10 inches apart. A little pinching back in early growth makes the plants bushy and shapely. Average height, 1 to 1½ ft.

PERENNIAL VARIETIES. This section includes the large-flowered sorts, and also the pretty, hardy pompons that make bright masses of color in our gardens long after heavy frosts have cut down other flowers. We wish to make quite clear the distinction between this class and the Annual Chrysanthemums, described above, that, as has sometimes happened heretofore, customers may not order seed of the Summer-blooming garden varieties, expecting them to yield the grand show flowers of late Fall. The great blooms of the exhibitions are obtained from cuttings carefully cultivated. For ordinary culture and room decoration, plants pinched back to form a number of branches and holding from 5 to 10 flowers are satisfactory. Average height of show kinds, 3 feet.

DELPHINIUM (Larkspur)

In variety and beauty of its blue tints, which are as numerous as they are charming, no other plant can equal the Delphinium. The brilliant flowers can be seen from a long distance and are strongly effective in beds or masses, in borders, shrubberies, or in combination with white lilies. Ordinarily the tall sorts are planted among shrubbery, or as a background for dwarfs, which are favorites for bedding. Improvements are continually being made in the size of the flowers, as well as in the length and fullness of the spikes. Some of the species flower both early and late; the season for all can be prolonged by cutting away withered flower-stems. They are sometimes increased by division, but are much more robust when grown from seed. All varieties are easily cultivated and adaptable to many conditions, but in a soil deeply dug and well enriched with fine old manure their blooms are the finest. They must have plenty of room to grow; 1½ to 2 feet each way is not too much for the taller sorts.

ANNUAL VARIETIES

These include the Rocket and Hyacinth-flowered, so called from their long, narrow flower spikes. They bloom best in a rather cool, moist soil. Sow seed in the open border, either in Spring or Fall, preferably the latter, so that germination may take place very early in Spring. As the seedlings grow, thin them to stand 6 to 18 inches apart, according to variety. The shades of color include light, dark and azure blue, white, buff, rose, apple blossom, pink, brick red, red lilac, dark lilac, violet, and fawn. The varieties are seldom kept separate, as they are quite as pretty and convenient for cutting when sown in mixture. Some of these are really hardy biennials, but because they bloom the first season we treat them as hardy annuals.

Used as a background for lower plants they are also very fine. Often the spikes are 2 or 3 feet long and thickly strung with scores of showy, thimble-shaped flowers. Seed may be sown outdoors in Spring and the seedlings transplanted where they are to grow, or, preferably, to a cold frame, where they make extra-strong plants that will flower in magnificent spikes the next season. Average height, 2 to 3 feet. Easily cultivated. When the center spike begins to fade it should be cut out, and the side shoots will, in consequence, grow more vigorously.

Although Hollyhocks are very permanent and hardy for the first Winter, it is advisable to sow seed every year, as the flowers on young, vigorous plants are much finer than old ones. Ipomœas grow so easily from annual sowings that it is no longer thought necessary to Winter-over roots or young cutting plants under glass. The large, horny seeds of some varieties should be soaked in hot water before planting. For early flowers, sow in hotbeds or pots and boxes under glass, and transplant to rich, deep soil in Summer quarters as soon as danger of frost is over, when sowings may also be made in the open ground. Nothing finer for porches, trellises, etc.

A marvelous range of new colors has been developed in this favorite flower, which for three or four months of the season makes a better display than almost any other plant. No other annual will produce such a lavish profusion of flowers for so long a time with the same small outlay of time and labor. The maximum of bloom is produced in thin soils, and never flags through the hottest weather. In soils too rich leaves predominate, and the plants are apt to rot off in wet weather, especially if standing too close.

In transplanting, set the taller kinds about a foot apart; if planted too thickly they suffer from mildew.

SALVIA (Flowering Sage)

The Salvia Splendens is a standard bedding plant that keeps the garden bright with color until late in Autumn. For pot culture, for cutting and for borders, etc., it is very valuable. In this climate sow seed in window-boxes or frames, in March or April, and set the plants outdoors the latter part of May; or sow outdoors not before June 1, and protect from heavy rains and strong winds. The plants grow and bloom profusely in any light, rich soil. Both the tender and hardy perennial sorts bloom the first year, and all are treated as annuals. Single plants carry hundreds of long, flaming flower-spikes open at one time, keeping up the display until frost.

STOCKS (Mathiola)

The plants have good habit, fine leaves, beautiful and fragrant flowers in all refined colors, a long season of lavish bloom, vigor and adaptability to many conditions of culture. For bouquets and floral work the double white sorts are especially useful. To secure fine early flowers, sow under glass in March or April, transplanting the seedlings when an inch high into other pots or boxes, or into fine soil spread over some discarded hotbed. In showery May weather, transfer to garden beds of deep, rich soil, setting the plants about a foot apart. Transplanting several times in the early stages of growth tends to give them a more dwarf and compact habit. For later flowers, sowings may be made in the open ground in May. If plants that begin to bloom late are carefully lifted and potted in Fall, they will flower finely all Winter in a house that is tolerably cool and moist. The blossoms are very lasting. Average height, 1 to 1½ feet.

SWEET PEAS

(*LATHYRUS ODORATUS*)

A deep, rich, moist soil is best suited to Sweet Peas. They are usually grown in double rows, with a wire trellis or a row of brush between. For each double row make the drills about 5 inches deep, and 9 or 10 inches apart. Sow plentifully, covering about 2 inches deep, and by degrees, as the vines grow up, fill the trenches with soil, and thin out to about 5 to 6 inches apart. Spring sowings should be made just as early as the ground can be prepared; frost does not hurt the little seedlings.

LILIES

All Lilies delight in rich soil, such as is afforded by a mixture of loam and well-rotted manure. CHRYSANTHEMUMS

Totty's Novelties, 1908

The novelties and others catalogued have attained the highest scoring during the recent exhibitions, and can be thoroughly recommended.

W. M. Moir. A monster Jap incurved white. This is the gold medal winner and the one which all will have to keep in line. Can be recommended with every confidence, it having scored 94 on the exhibition scale and 92 on the commercial scale before the C. S. A., much the highest scoring of any variety set up this year. It is an Australian and has won high honors in three countries; a remarkable showing, truly. Stem and foliage A1. Stock limited. Height 4 to 5 feet. Bud August 20th onward. Each 75c., doz. \$7.50, 100 \$60.00.

Reflexed Eaton. Identical in every respect with Eaton, save that the petals gracefully reflex instead of turning in as they do in the present variety. To that large class of commercial growers who swear by Eaton, this variety will appeal, as Messrs. Dailedouze, who have handled this variety, say that it is in every way as profitable as the parent. As an exhibition flower it will be much better than Eaton, as the spreading florets make a better showing. Each 50c., doz. \$5.00, 100 \$35.00.

O. H. Broomhead. This is a fine variety, rose pink in color, with a perfect foliage and stem and not a fault so far as can be seen. A dwarf grower and every plant produces a perfect flower. Height 3 feet. Buds taken from August 10th to September 10th, all finished perfectly. Winner for best 6 new pink, New York show. Each 50c., doz. \$5.00, 100 \$35.00.

Mary Donnellan. A splendid golden yellow and a grand keeper and shipper. The flower shown in the photograph had been shown in winning classes at Madison and New York a week apart and was still perfect when picture was taken. It is a tall grower, and April propagation should be early enough. It is a trifle bare at the neck, but foliage is grand and the stem like a steel rod. Height 6 feet. Bud taken August 20th onward. First New York show for 6 yellow, certificated C. S. A. Each 50c., doz. \$5.00, 100 \$35.00.

Mrs. Joseph Sinnott. A favorite variety, raised in Philadelphia and fine as a commercial or exhibition flower. Stem and foliage perfect, color is a rose purple with a light pink reverse, petals are hard and leathery and will stand any amount of hard usage. This variety also makes a splendid bush plant and is a free kind grower. Height 4 to 4½ feet. Bud August 20th and later. Each 50c., doz. \$5.00, 100 \$35.00.

Mrs. Norman Davis. A fine Japanese white with a splendid record in England, and, it is believed, will have an equally fine record here next year. It is as large as Mrs. D. V. West, and the stem is fully equal to carrying the flower. The foliage is carried up to the flower, leaving no neck whatever, and it will be hard for the critic to find a fault with this variety. Stock limited. Each 75c., doz. \$7.50, 100 \$60.00.

Grace Witney. This is an American seedling certificated by the C. S. A., November 2. It is a Japanese pink of fine color and much substance with close heavy foliage up to the flower. It is large enough to travel in any company and should be able to speak for itself next year. The raiser informs me that it is an easy doer and a crown bud late in August will give best results. Height 5 feet. Each 50c., doz. \$5.00, 100 \$35.00.

We also have many other sorts and would be pleased to send special list on request.

Dorothy Goldsmith. Should make an enormous flower next year. One grower called it a bronze F. S. Vallis, which is a good description. The picture shows a flower not nearly finished, yet the petals are 10 inches long. Flower and foliage correspond to F. S. Vallis. This should be a whopper for the biggest flower in the show. Height 4 to 4½ feet. Any bud after August 15th. Each 50c., doz. \$5.00, 100 \$35.00.

Mary Mason. A splendid dwarf grower, not over 3½ feet high, flower extra large color old rose and red, somewhat on the order of Mrs. John E. Dunne, but showing brighter coloring. This will be a splendid addition to the any other class, and as it is such an easy doer will be well grown by everyone. Best flower from bud, August 15th with me. Each 50c., doz. \$5.00, 100 \$35.00.

Miss Kittie Lawrence. A beautiful delicate fawn color which the picture does not do justice to. The petals are large and beautifully curled, and the plant is a good, clean grower. Stem and foliage leave nothing to be desired. Certificate American Institute. Height 4 to 5 feet. Bud August 20th and later. Each 50c., doz. \$5.00, 100 \$35.00.

Mrs. Giraud Foster. An American seedling certificated in Philadelphia by the C. S. A. Flower creamy white, with petals incurving and building up a beautifully finished flower. Foliage and stem perfect and flower a splendid keeper and shipper. Each 50c., doz. \$5.00, 100 \$35.00.

Mrs. W. Wells. A bronzy, reddish orange, very difficult to describe. If this flower had a little more body it would doubtless be the best thing of the year, as the color is unique. As it is, it is a beautiful and striking variety for the collection classes. Stem perfect; foliage up to the flower. Height 4 feet. Any bud after August 10th. Each 50c., doz. \$5.00, 100 \$35.00.

Mrs. J. C. Neill. Almost a duplicate of Cheltoni in style, color and habit. Stock was so small when received that the plant has not done itself justice, but M. Wells says it has Cheltoni beaten hollow for size when well done. Height 3½ feet; treat like Cheltoni. Each 50c., doz. \$5.00, 100 \$35.00.

Lynnwood Hall. An American variety, winner of the Smith prize for best American seedling, New York, and several other prizes. A fine stem with foliage up to the flower, certificates by the C. S. A. on the commercial scale. Color pure white, almost a duplicate of the old Convention Hall. Height 5 feet; late crown bud. Each 50c., doz. \$5.00, 100 \$35.00.

Andrew McKendry. Certificated, New York, October 15th as No. 20. Certificated also New York Florists' Club. Color is a warm cerise with bronze reverse. Plant is a splendid grower and will be valuable for the early shows. Height 4 feet. Takes crown bud August 10th and later; September buds produce poor flowers. Each 50c., doz. \$5.00, 100 \$35.00.

Dicky Vince. A canary yellow sport of Mrs. F. F. Thompson. This shows the same long neck as the parent and is useful only for the short vase classes, but the flower is one of the most beautiful ever staged and to those growers who like the parent it is recommended with every confidence. Each 50c., doz. \$5.00, 100 \$35.00.

No. 4 Combined Hill and Drill Seeder, Single Wheel Hoe, Cultivator and Plow.

PRICE, COMPLETE, \$10.00; AS A DRILL ONLY, \$8.00.

This admirable tool combines in a single convenient implement a capital hill dropping seeder, a perfect drill seeder, a single wheel hoe, a cultivator, a rake and a plow. It holds three pints, sowing in continuous rows or dropping in hills at 4, 6, 8, 12 or 24 inches apart. It is thrown out of gear by simply raising the handles. The index is accurate, simple and easily set. The drill is detached and the tool frame substituted by removing but one bolt. It then becomes a single wheel hoe, garden plow or cultivator. It is useful almost every day of the season, at every stage of garden work. With this one implement the small farmer can do practically all the work in his small crops.

No. 12 Double Wheel Hoe, Cultivator and Plow.

PRICE, - - - \$7.00

This tool will do the work of six to ten men with ordinary hand hoes, and is the best machine made for all who raise onions or garden vegetables on an extensive scale. The wheels can be set at four different distances apart; the frame at three different heights; handle adjustable; arch of steel and extra high, and all the tools are of tempered and polished steel. The leaf guards allow cultivating large plants such as beets, carrots, parsnips, beans or peas. We can heartily recommend it.

Farmers' No. 19 Single Wheel Hoe, Cultivator and Plow.

PRICE, - - - \$3.50

This new and attractive implement is especially designed for the farmer's garden work, though it offers to every one with either field or garden a cheap and effective tool for all hand-wheel hoe operations. The wheel is extra high, the wheel arms are steel, and the frame attached so that the height of the handles may be readily changed to suit man or boy. All the attachments are tempered and polished steel. Strength, variety of tools and cheapness are its great virtues.

The "Fire-Fly" Garden Plow.

PRICE, - - - \$2.25

This tool is most useful in small gardens, opening up beds for seeds, and covering them quickly. Completely made of tempered and polished steel; the depth is adjustable.

The emblem is a symmetrical scrollwork design in gold ink. It features a central rectangular area containing the year "1908". This central area is surrounded by two layers of scrolling arms that meet at the top and bottom in a decorative, acanthus-like pattern. The entire emblem is rendered in a shiny gold color against a dark brown background.
